

Additional Requirements from Latest Customer Meeting

Kuya Bong App — Summary for Blueprint Update v0.6

1. Clinic Management

Kuya should be able to manage clinic records from the admin side of the app.

Required capabilities:

- Add a new clinic.
- Edit existing clinic details.
- Deactivate an existing clinic so it no longer appears for new bookings.
- Delete a clinic only if there are no appointments, bookings, sales, packages, or other historical records linked to it.

Key rule:

If a clinic already has historical transactions, it must not be deleted. It should only be deactivated.

2. Announcements and Push Notifications

Kuya should be able to create announcements and push them to registered customers through app notifications.

Examples:

- Product promotion, such as “Buy one get one free”.
- Clinic notice, such as “Clinic B is under maintenance”.
- Schedule notice.
- General business update.

Required capabilities:

- Create announcement title and message.
 - Push announcement notification to registered customers.
 - Set expiry date.
 - Automatically hide announcement after expiry.
 - Manually pull or unpublish announcement before expiry.
 - Keep announcement history for admin reference.
-

3. Product Photo Management

Kuya should be able to upload one or more photos for each product.

Required capabilities:

- Upload product photo or multiple photos.
- Automatically compress and resize high-resolution images before storage.
- Display product photos when users view product information.

Key rule:

The system should not store unnecessarily large product images. Uploaded images should be optimized automatically.

4. Family Members

The app should continue to support **Family Members** as a separate category.

Family Members may include:

- Spouse.
- Children.
- Parent.
- Sibling.
- Other family member.

Patients should be able to add or link family members. If the family member is already a registered user, the linked user must receive a notification and confirm the relationship before the link becomes active.

Family members may be used for:

- Booking a session on behalf of a family member.
- Sharing package usage, if allowed.
- Tracking which family member used each package session.

Key rule:

Family Members and Friends must remain separate categories so Kuya and users can clearly understand the relationship type.

5. Friends and Package Credit Transfer

The app should support **Friends** as a separate category from Family.

A Friend must be a registered user before they can receive transferred package credit.

Friend Linking Process

If User A wants to add User B as a Friend:

1. User A sends a friend-link request to User B.
2. User B receives an app notification.
3. User B must acknowledge and confirm that User A is his/her Friend.
4. The Friend link becomes active only after confirmation.

The same confirmation process should also apply to Family linking when both people are registered users.

Friend Usage Rules

Different from Family:

- A user cannot book a session on behalf of a Friend.
- A Friend cannot directly use the user's package.
- If a user wants to share package benefits with a Friend, the user must transfer remaining package credit to that Friend.

Package Credit Transfer Rules

- User A can transfer package credit to User B only if User B is a registered user and confirmed Friend.
- Once User B is linked as Friend, User A can transfer package credit to User B.
- User B can also transfer package credit to User A.
- Transferred credit keeps the same expiry date as the original package.
- The system must record who transferred the credit, who received it, amount of credit transferred, original package reference, and expiry date.

Key rule:

Package credit transfer to Friends is allowed only after both users are registered and the Friend relationship is confirmed.

6. Master Admin and Sub-Admin Permission Control

Kuya is the **Master Admin**.

As Master Admin, Kuya can appoint registered users as Sub-Admins and remove their Sub-Admin access.

Instead of giving all Sub-Admins the same fixed access, Kuya should have one configuration panel to control what all Sub-Admins can do or see.

This configuration applies to all Sub-Admins.

Sub-Admin Permission Panel

Kuya should be able to enable or disable Sub-Admin access using checkboxes:

No.	Permission
1	Manage Booking: create, edit, or delete time-slot availability. If disabled, Sub-Admin can only view calendars like a normal user.
2	Appointment Management: complete session, cancel patient appointment, reschedule user, etc.
3	Manage Clinics: create, edit, delete, or deactivate clinics.
4	Manage Therapists: create, edit, delete, or deactivate therapists.
5	Manage Patients: assign package, record purchase, update patient-related operational data, etc.
6	Manage Products: create, edit, delete, deactivate products.
7	Manage Service Types.
8	Manage Cancellation Reasons.
9	Manage Announcements.
10	Manage Follow-Up List.
11	Generate Financial Reports — Services only.
12	Generate Financial Reports — Products / Sales only.

Key rules:

- Only Master Admin can appoint or remove Sub-Admins.
- Sub-Admins cannot appoint or remove other Sub-Admins.
- Sub-Admins cannot change Master Admin access.
- Sub-Admin permissions are controlled from one central configuration panel.
- Important admin and sub-admin actions should be logged for audit purposes.

7. Financial Ad-Hoc Reports

Kuya should be able to generate financial reports from the mobile app.

Report filters:

Filter	Description
Category	Services or Products
From Date	Defaults to first day of current month

Filter	Description
To Date	Defaults to today's date
Service	Appears only when Category = Services; default is All
Product	Appears only when Category = Products; default is All

Validation rule:

- From Date must not be later than To Date.

Report output:

- If Services is selected, show completed therapy sessions within the selected date range.
- If Products is selected, show sold products within the selected date range.
- Report should include the related amount or income value if recorded.

Kuya should be able to share the generated report from his mobile app, preferably as PDF.

8. Household Spending and Active Package Report

An additional report is required to show spending and active package information at household level.

For this requirement, Household means the main patient account plus linked Family Members.

The report should show:

- Main patient account owner.
- Linked family members.
- Total spending amount.
- Active package or subscription.
- Package start date and expiry date.
- Total sessions included.
- Sessions already used.
- Remaining sessions.
- Which family member used each session.
- Friend credit transfers, if relevant.

9. Main Open Questions

1. Can users transfer partial package credit to Friends, or only full remaining credit?
2. Should transferred credit be measured by number of sessions, money value, or both?
3. Can transferred credit be transferred again to another Friend?
4. Can package credit transfer be cancelled or reversed by Kuya?

5. Should Sub-Admin permissions take effect immediately after Kuya changes the configuration?
 6. Should Sub-Admins be allowed to see reports only if the relevant financial-report checkbox is enabled?
 7. Should announcement push be sent to all users or selected users only?
 8. Should report sharing be PDF only, or also Excel/CSV later?
-

10. Recommendation

These requirements should be added to the Product Concept and Solution Blueprint as **Version 0.6**.

Important updates from Version 0.5:

- Replace “Trusted Contacts” with **Friends**.
- Keep **Family** and **Friends** as separate relationship types.
- Family can support booking and package usage, subject to rules.
- Friends cannot be booked for directly and cannot use packages directly.
- Friends can receive transferred package credit only after both users are registered and the Friend relationship is confirmed.
- Sub-Admin access should be controlled by Kuya through one permission configuration panel.
